

PART 4

HANDS-ON LAB

Part 4 — Hands-On Lab

The room builds a standard together — the five-beat arc from taxonomy to a built, gated RI.

4.1 · Select the standard

4.2 · Build it live

The whole room builds ONE standard together — live, field by field.

Breadth is exposure to all three dimensions; depth is taking **one the whole way**.

The payoff is Monday-morning capability — not knowing *about* standards, but producing one.

Output: a concrete, gated, auditable reference implementation — owned by the Central AI Factory.

The Anatomy of a Standard

Twelve fields — the metadata every standard carries. This is the template the room will fill in 4.2.

WHAT IT IS the substance Statement The one sentence — what must be true. Problem The production failure it prevents. Solution The control, in concrete terms.	HOW IT'S CLASSIFIED the metadata tags Maturity Level Where it sits today, and the target. Applicability applies_to {ML, LLM, agent} — who it binds. Criticality The risk / value rating.	HOW IT'S GOVERNED ownership & anchoring Ownership The named owner accountable for it. Change Control How it's versioned and revised. Framework Mappings Anchor to the AWS GenAI Lens; <i>na</i> if beyond.	HOW IT'S ENFORCED the teeth — where the thesis lands ★ Enforcement Gate The objective pass/fail test. No gate, no standard. ★ ARB Evidence What proves the gate passed — the audit trail. Reference Implementation The concrete build it all points to.
--	---	---	--

Twelve fields — but two carry the whole standard.

★ ENFORCEMENT GATE

An objective pass/fail test you could actually run — not a vague intention.

★ ARB EVIDENCE

The artifact trail that proves the gate passed — a gate with no evidence can't be audited.

No gate, no standard — just a wish. The bulk of 4.2 lives on these two.

Your Turn — Build the Standard You Selected

Two tasks: fill in every taxonomy field, then develop the reference implementation — central builds, local wires in.

1

Fill in the taxonomy — every field

Complete all 12 fields of the anatomy for the standard you selected — crowdsource each one, as a room.

Statement	Problem	Solution	Maturity Level	Applicability	Criticality
Ownership	Change Control	Framework Mappings	★ Enforcement Gate	★ ARB Evidence	Reference Impl.

Don't skip the two gold fields — Enforcement Gate (an objective pass/fail test) and ARB Evidence (what proves it passed). No gate, no standard — just a wish.

2

Develop the reference implementation

Build once, wire in many — decide who does what across the two teams.

CENTRAL AI FACTORY

build it once · for everyone

BUILDS

the validator, threshold table, endpoint contract, shared SDK — the machine.

OPERATES

semver, N-1 support, patches; runs the CI gate as a service with an SLA.

OWNS

the standard, the gate, and the evidence contract.

LOCAL / PROJECT TEAMS

wire in · don't rebuild

CONFIGURES

routes every call through the one declared endpoint; supplies config + adapter.

POPULATES

project-specific inputs, scenarios, and data.

CONSUMES

runs the central gate in CI, produces ARB evidence — doesn't fork the control.

The interface contract IS the standard — the gate proves compliance, it doesn't trust it.

Outcome: one concrete RI — owned by the Central AI Factory, enforced at CI/CD gates, fully auditable.
